Introduction

We came up with the idea of showing the architecture-based movie "Skyscraper" as a weekly activity to help architecture students learn about architecture in an engaging way while also familiarizing them with how modern architecture is being redefined in the context of multicultural cities as a result of globalization. This will give an overview of how structure has evolved to its current forms.

Results and Discussion

Students learn about the role of architects in practice and the relevance of using the most recent development and design strategies while developing high-rise buildings. The movie was paused in the middle of a scene on the screen, and mini lessons were given to comprehend the design features, zonal activities, and sustainable factors of the structure. Following the film, a quiz was given, and the student's responses about the role architecture plays in high-rise buildings were clear and overall positive.

Conclusion

With the right coaching, it was a fantastic and engaging way to quickly impart knowledge to students. In addition to learning about the most recent developments, problems, and design principles controlling structures at the national and international levels, students were also able to gain an understanding of the numerous factors that determine the form of structures.
