SUMMARY REPORT

This is to inform that, Excel Engineering College, Department of Computer Science and Business Systems conducted "JAVA PROGRAMMING LANGUAGE" from 15-10-2022 to 20-10-2022, all students attended the programme and gained knowledge Java programming Language.

The Session was more interested and interactive, students asked many questions regarding the java language and get cleared their doubts. Java is a high-level, class-based, object-oriented programming language that is designed to have as few implementation dependencies as possible.

JAVA was developed by James Gosling at Sun Microsystems Inc in the year 1995, later acquired by Oracle Corporation. It is a simple programming language. Java makes writing, compiling, and debugging programming easy. It helps to create reusable code and modular programs.

In 1997, Sun Microsystems approached the ISO standards body and later formalized Java, but it soon withdrew from the process. At one time, Sun made most of its Java implementations available without charge, despite their proprietary software status. Sun generated revenue from Java through the selling of licenses for specialized products such as the Java Enterprise System.

On November 13, 2006, Sun released much of its Java virtual machine as free, open-source software. On May 8, 2007, Sun finished the process, making all of its JVM's core code available under open-source distribution terms.

SUMMARY REPORT

This is to inform that, Excel Engineering College, Department of Computer Science and Engineering conducted "BUILD PYTHON WEB APPS WITH DJANGO & FLASK" from **15-02-2023** to **20-02-2023**, all students attended the programme and gained knowledge on different Python Frameworks.

The Session was more interested and interactive, students asked many questions regarding the Python language and get cleared their doubts. Django is a free programming language with improved features and performance. Django is preferred by developers because it allows them to use it for standard functions with minimal interference from systems, protocols, and management.

Django is also known as a 'framework for fussy budgets with deadlines,' because it promotes rapid development and clean, pragmatic design. The framework's agile development process focuses solely on delivering quality in a timely and efficient manner. Site maps, content organization, client information, and many other basic development functions are handled quickly by Django. It's a flexible framework that can be used to build any website (social network, news site, content management system, and so on) with content in HTML, XML, JSON, and other formats. It can be used in conjunction with any client-side framework.

Flask is another Python-based micro framework for developing web applications. Armin Ronacher introduced it in 2011 as a test method for combining two solutions: Werkzeug (a server framework) and Jinja2 (a template library). It was supposed to be a test run in a zip file that eventually stems from Flask's positive influence.

Flask supports multiple types of databases by default because it has no default model. This also simplifies the integration of databases into Flask applications. Flask will make your life easier than Django if you're looking to create a simple web app with a few static pages. Many programmers find Flask to be easily scalable for smaller web applications. It comes with a built-in development server and fast debugger.

SUMMARY REPORT

This is to inform that, Excel Engineering College, Department of Computer Science and Engineering conducted "Value Added Course on Machine Learning Using Python" from 12.11.22 to 17.11.2022, all students and faculty members attended the Programme and gained knowledge.

. Machine learning is a vast area of research that is primarily concerned with finding patterns in empirical data. We restrict our attention to a limited number of core concepts that are most relevant for quantum learning algorithms. We discuss the importance of the data-driven approach, compared with the formal modeling of traditional artificial intelligence. We outline how to build high-dimensional feature spaces that will correspond to quantum states in quantum computing. An algorithm's ability to generalize beyond training data is intrinsically linked with its complexity—this is the foundation of the Vapnik-Chervonenkis theory, which we briefly explain. There is no free lunch, however: a single algorithm will not work in every learning scenario, which leads to combinations of learners and ensembles. Dependence on the dimensions and volume of the data defines computational complexity for learning methods, which often do not scale well.
